**Question:**

I have used the "Check out" tool to check out the computer from the network and remove the network connection.  
Why is Workgroup Manager no longer working?

**Answer:**

Windows disables network functionality as soon as you remove the network connection (unplug the network cable).  
Running Allplan, however, requires specific network protocols (even if the computer is checked out).

**Solution:**

To make sure that the operating system's network functionality is not interrupted, you can install a virtual network interface card.  
Microsoft provides a driver for this (loopback adapter).

How to install:

**Windows 8/10:**

Right-click the Windows Start button -> select "Run".  
Type in "hdwwiz" in the search field. Right-click the program found -> select "Run as admin".  
Click Next -> select the required hardware manually in a list and install it -> click "Next".  
Select "Network adapter" in the list -> click "Next".  
Select "Microsoft" in the list on the left -> "Microsoft loopback adapter for KM TEST" is presented for selection on the right -> click "Next" -> click "Next".

**Windows 7:**

Click the Windows Start button -> type in "hdwwiz" in the search field. Right-click the program found -> select "Run as administrator".

Click Next -> select the required hardware manually in a list and install it -> click "Next".

Select "Network adapter" in the list -> click "Next".

Select "Microsoft" in the list on the left -> "Microsoft loopback adapter" is presented for selection on the right -> click "Next" -> click "Next".

**Windows Vista:**

Start the "Hardware Wizard" by selecting

**Start -> Control Panel -> Hardware** and clicking **Continue -> Next**.

Select "Install the hardware that I manually select from a list (advanced)" in the box and choose "Network adapter" in the list that follows.

This selects and installs the "Microsoft loopback adapter".
